^aThe NMR signals were shown to be doubling due to some degree of hindered rotation of the aryl-naphthalene bond.

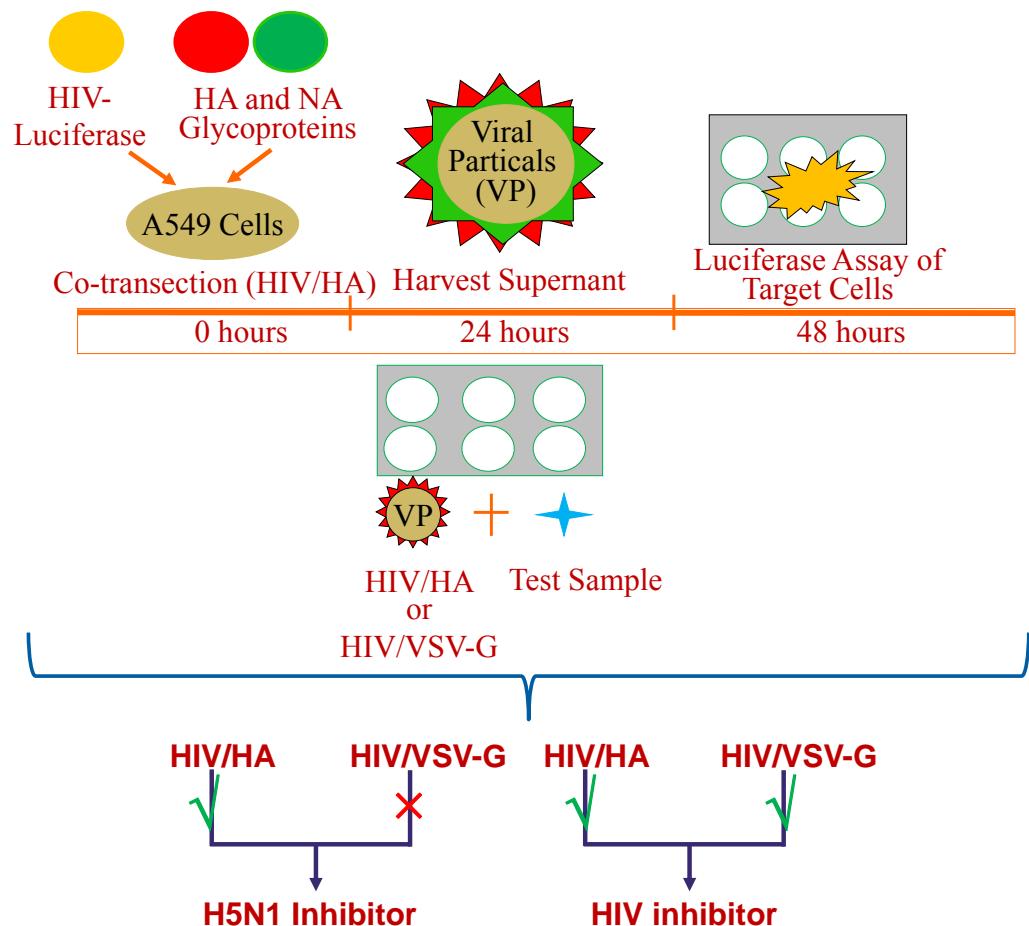

Figure S1. “One-Stone-Two-Birds” evaluation system. The HIV vector carrying luciferase gene is used as the reporter for viral replication. The HIV vector is co-transfected with bird flu H5N1 HA and NA constructs to generate HIV virions with bird flu HA on the viral surface (HIV/HA). The generated HIV/HA cells will then be placed in a 24 wells plate, incubated for 48 hours with samples or without samples. The cells will be harvested to measure the luciferase levels. In the assay system, we run HIV/HA and HIV/VSVG in parallel. HIV/VSVG is VSV-G pseudotyped HIV virions without bird flu HA coated on the surface. When a sample is tested to inhibit HIV/HA but not HIV/VSVG, we consider it as a potential bird flu inhibitor. However, when a sample is tested to inhibit both HIV/HA and HIV/VSVG, we consider it as a potential HIV inhibitor.
