## 1. General Methods:

All reactions were carried out with distilled and dried solvents purchased from Sigma-Aldrich and Merk using oven-dried glassware. ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz} / 400 \mathrm{MHz} / 500 \mathrm{MHz}$ ) and ${ }^{13} \mathrm{C}$ NMR ( $75 \mathrm{MHz} / 100 \mathrm{MHz} / 125 \mathrm{MHz}$ ) and COSY, NOESY ( 500 MHz ) and HOESY (500 MHz ) were recorded in $\mathrm{CDCl}_{3}$ on Bruker NMR instrument. The NMR spectras were processed using top-spin Bruker and MestreNova NMR softwares. Chemical shifts are reported in $\delta$ units (parts per million/ppm) with reference to TMS as an internal standard. Melting points was recorded using Thomas Hoover melting point apparatus and are uncorrected. Optical rotations were measured on a JASCO P-1020 a digital polarimeter with sodium light ( 589.3 nm ) at $25^{\circ} \mathrm{C}$. High resolution mass spectra (HRMS) were recorded in positive as well as negative ion electron spray ionization (ESI) mode using a TOF (time of flight) analyzer. Thin layer chromatography was performed on pre-coated plates ( 0.25 mm , silica gel 60 F254, Merk). Column chromatography was carried out with silica gel (100-200 mesh). IR spectra were recorded on Shimadzu FT-IR spectrophotometer as a thin film or using KBr pellets in solid state and using IR solution cell in solution state and reported in $\mathrm{cm}^{-1}$. The coupling reagents such as $1-[\operatorname{Bis}($ dimethylamino)methylene]-1H-1,2,3-triazolo[4,5-b]pyridinium 3-oxid hexafluorophosphate (HATU), 2-Chloro-1-methyl pyridinium iodide (CMPI), Solvents like Diisopropylethylamine (DIPEA), Tetrahydrofuaran (THF), Methanol (MeOH), acetonitrile were purchased from Sigma-Aldrich, which are used in solution phase peptide coupling reactions. After neutralization, workup involves washing of the combined organic layer with aqueous sodium bicarbonate, 1 N HCl , water, brine, drying over anhydrous sodium sulfate and evaporation of solvent under reduced pressure. Circular dichroism (CD) was performed on JASCO J-1500 CD spectrometer using a cell of 2 mm path length. Spectra were recorded as an accumulation of 3 scans using a scan speed of $100 \mathrm{~nm} / \mathrm{min}$, with resolution of 1.0 nm , band-width 5.0 nm and a response of 1 sec . Spectra were smoothened (5) and plotted using Origin Pro 6.0 software. Restraint molecular dynamics (MD) studies were carried out using the MacroModel with OPLS force field, version 10.3 program from Schrodinger software. The constraints were derived from the volume integrals obtained from the NOESY spectra using a two-spin approximation and a reference distance of $1.8 \AA$ for the geminal protons. The upper and lower bound of the distance constraints have been obtained by enhancing and reducing the derived distance by $10 \%$. For ion transport study egg-yolk phosphatidylcholine (EYPC) and diphytanoylphosphatidylcholine (DPhPC) were obtained from Avanti Polar Lipids as a solution ( $25 \mathrm{mg} / \mathrm{mL}$ in $\mathrm{CHCl}_{3}$ ) and solid respectively. 2-[4-(2-hydroxyethyl)piperazin-1-
yl]ethane sulfonic acid (HEPES) buffer, 8-hydroxypyrene-1,3,6-trisulfonate (HPTS) dye, lucigenin, Triton $\mathrm{X}-100, \mathrm{NaOH}$ and inorganic salts were purchased of molecular biology grade from Sigma. The HEPES buffer solution was prepared in the Milli-Q water, which was collected from the filtration set up. The water was further autoclaved to get rid of microbial and related contaminations. The water was autoclaved prior to the buffer preparation because some buffers (e.g. HEPES) are not high temperature resistant. Dimethyl sulfoxide (DMSO) was purchased from Sigma-Aldrich. Fluorescence spectra were recorded from Fluoromax-4 from Jobin Yvon Edison equipped with an injector port and a magnetic stirrer. Measurements of pH were done using a Helmer pH meter. All data from fluorescence studies were processed either by KaleidaGraph 3.51 or Origin 8.5 program.

## 2. Experimental Procedure:

## General Procedure for hydrolysis of methyl ester:

The methyl ester compound (1 equiv.) was dissolved in THF: $\mathrm{MeOH}: \mathrm{H}_{2} \mathrm{O}$ (3:1:1) mixture $(100 \mathrm{mM})$. The solution was stirred at $0{ }^{\circ} \mathrm{C}$ for 5 min . LiOH ( 2.5 equiv.) was added slowly and the mixture was stirred vigorously at rt for 2 h . The solvent was concentrated under vacuo and diluted with water and acidified to approx. pH 4 with 2 N HCl solution. The aqueous layer was extracted with ethyl acetate (Three times). The combined organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo to give the crude product. (For details, see individual procedures.)

## General Procedure for conversion of azide to amine:

Azide compound (1 equiv.) was subjected for reduction in presence of $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}$ (cat.) in methanol at rt for 2 h . Reaction mixture was filtered through celite bed. Organic solvent was concentrated under vaccum to give Product. (For details, see individual procedures).

## General Procedure for Peptide coupling reaction:

To the stirred solution of amine compound ( 1 mmol ), DIPEA ( 1 mmol ) in dry $\mathrm{CH}_{3} \mathrm{CN}$ under nitrogen atmosphere, acid compound ( 1 mmol ) was added at $0{ }^{\circ} \mathrm{C}$ and stirred for 5 min ; then HATU ( 1 mmol ) was added at same temperature. After 5 min reaction was allowed to room temperature and continued for 12 h . Reaction mixture was diluted with EtOAc ( 100 mL ) and the organic layer was washed with $1 \mathrm{M} \mathrm{HCl}(50 \mathrm{~mL})$ and saturated aqueous $\mathrm{NaHCO}_{3}(50 \mathrm{~mL})$ and brine. The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo to give the crude product of peptide which was purified by column chromatography. (For details, see individual procedures).

## General Procedure for Peptide macrocyclization via intramolecular coupling reaction:

Linear peptides ( 1 mmol ) were dissolved in THF:MeOH: $\mathrm{H}_{2} \mathrm{O}$ ( $3: 1: 1$ ) mixture ( 100 mM ). The solution was stirred at $0{ }^{\circ} \mathrm{C}$ for 5 min . LiOH ( 2.5 equiv.) was added slowly and the mixture was stirred vigorously at rt for 2 h . The solvent was concentrated under vacuo and diluted with water and acidified to approx. pH 4 with 2 N HCl solution. The aqueous layer was extracted with ethyl acetate (Three times). The combined organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The solvent was removed in vacuo to give the crude product. This crude product containing azide was reduced in presence of $\mathrm{H}_{2}, 10 \% \mathrm{Pd} / \mathrm{C}$ (cat.) in methanol at rt for 2 h . Reaction mixture was filtered through celite bed. Organic solvent was concentrated under vaccum to give crude deprotected amine-acid terminal of peptide as crude material.

The crude amine-acid linear peptides 7 (1mmol) and 9 (1mmol) were dissolved in dry $\mathrm{CH}_{3} \mathrm{CN}$ separately, with high dilution $(\sim 0.005 \mathrm{M})$ under inert atmosphere (Nitrogen gas),DIPEA (1mmol) and CMPI/HATU (1mmol) was added at rt. Reaction mixture was stirred for overnight at rt. Reaction mixture was diluted with EtOAc ( 50 mL ) and the organic layer was washed with $1 \mathrm{M} \mathrm{HCl}(\mathrm{aq})(25 \mathrm{~mL})$ and saturated aqueous $\mathrm{NaHCO}_{3}(25 \mathrm{~mL})$ and brine. The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4(\mathrm{~s})}$. The solvent was removed in vacuo to give the crude product of cyclic peptide which was purified by column chromatography. (For details, see individual procedures).

## 3. Synthesis and characterization:

(3S)-Carbonyloxy-[L-Val-OMe]-3-deoxy-3-fluoro-5-deoxy-5-amino-1,2-O-isopropylidene-$\alpha$-D-xylo-1,4-furanose (4):
The compound $3^{[1 \mathrm{~S}]}(2.5 \mathrm{~g}, 7.17 \mathrm{mmol})$ was subjected for reduction in presence of $\mathrm{H}_{2}, 10 \%$ $\mathrm{Pd} / \mathrm{C}$ in methanol at rt for $2 \mathrm{~h}\left(R_{f}=0.3\right.$, EtOAc: MeOH (9.5:0.5). Reaction mixture was filtered through celite bed. Organic solvent was concentrated under vaccum to give thick liquid ( $2.1 \mathrm{~g}, 90 \%$ yield), $[\alpha]_{\mathrm{D}}{ }^{25}=-6.66,\left(c=0.10, \mathrm{MeOH}\right.$ ), IR (neat): $v_{\max }=3423.76$ (br), 3373.61 (br), 2966.62, 1741.78, $1685.84 \mathrm{~cm}^{-1}$.
${ }^{1} \mathrm{H} \operatorname{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=7.19(\mathrm{bd}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NH}-\mathrm{val}), 6.01(\mathrm{~d}, J=3.8 \mathrm{~Hz}, 1 \mathrm{H}$, $\mathrm{C} 1 \mathrm{H}), 4.70-4.58(\mathrm{~m}, 3 \mathrm{H}, \mathrm{C} 2 \mathrm{H}, \mathrm{C} 4 \mathrm{H} \& \mathrm{Val} \alpha \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OMe}), 3.08-2.93(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{C} 5 \mathrm{H}), 2.30-2.15(\mathrm{~m}, 1 \mathrm{H}, \mathrm{Val} \beta \mathrm{H}), 1.91\left(\mathrm{bs}, 2 \mathrm{H}\right.$, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}, \mathrm{NH}_{2}\right), 1.58(\mathrm{~s}, 3 \mathrm{H})$, $1.35(\mathrm{~s}, 3 \mathrm{H}), 0.97(\mathrm{~d}, J=6.8,3 \mathrm{H}), 0.94(\mathrm{~d}, J=6.9,3 \mathrm{H})$.
${ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=171.2,164.9(\mathrm{~d}, J=21.9 \mathrm{~Hz}), 113.8,104.9,100.6(\mathrm{~d}, J=$ $193.6 \mathrm{~Hz}), 85.0(\mathrm{~d}, J=37.2 \mathrm{~Hz}), 82.7(\mathrm{~d}, J=21.9 \mathrm{~Hz}), 57.3,52.4,39.5(\mathrm{~d}, J=7.8 \mathrm{~Hz}), 31.2$, 27.0, 26.7, 19.0, 17.9. HRMS (ESI-TOF) $m / z:[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{FN}_{2} \mathrm{O}_{6}, 349.1769$, found 349.1764 .

## D-xylo-1,4-furanose (5):

Compound 3 ( $2.1 \mathrm{~g}, 5.61 \mathrm{mmol}$ ) was hydrolyzed using above general procedure for hydrolysis of methyl ester that afforded acid compound 5 as a white solid, $2 \mathrm{~g}, 95 \%$ yield, , $\left(R_{f}=0.5, \mathrm{EtOAc}\right) \mathrm{Mp}=135-137{ }^{\circ} \mathrm{C},[\alpha]_{\mathrm{D}}{ }^{25}=-17.33(c=0.11, \mathrm{MeOH})$, IR $(\mathrm{KBr}): v_{\max }$ $=3399.5$ (br), $3390-2800,2096.4\left(\mathrm{~N}_{3}\right), 1724,1691 \mathrm{~cm}^{-1}$.
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=6.88$ (dd, $\left.J=8.8 \& 1.6 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NH}-\mathrm{val}\right), 6.06$ (d, $J=3.9$ $\mathrm{Hz}, 1 \mathrm{H}, \mathrm{C} 1 \mathrm{H}), 4.85-4.76$ (m, 1H, C4H), 4.67 (dd, $J=14.8 \& 3.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 2 \mathrm{H}), 4.60(\mathrm{dd}, J$ $=8.3 \& 4.4 \mathrm{~Hz}, 1 \mathrm{H}, \operatorname{Val} \alpha \mathrm{H}), 3.60(\mathrm{dd}, J=13.2 \& 6.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 5 \mathrm{H}), 3.43(\mathrm{dd}, J=13.2 \& 5.2$ $\mathrm{Hz}, 1 \mathrm{H}, \mathrm{C} 5 \mathrm{H}), 2.35-2.25(\mathrm{~m}, 1 \mathrm{H}, \mathrm{Val} \beta \mathrm{H}), 1.58\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.35\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.03(\mathrm{~d}, J=$ $\left.6.8,3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.99\left(\mathrm{~d}, J=6.9,3 \mathrm{H}, \mathrm{CH}_{3}\right)$.
${ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=175.6,164.2(\mathrm{~d}, J=21.9 \mathrm{~Hz}), 114.1,105.2,100.0(\mathrm{~d}, J=$ 195.3 Hz ), $84.6(\mathrm{~d}, J=37.2 \mathrm{~Hz}), 79.8(\mathrm{~d}, J=19.5 \mathrm{~Hz}), 57.0,48.2(\mathrm{~d}, J=8.0 \mathrm{~Hz}), 30.9,26.9$, 26.5, 18.9, 17.56. HRMS (ESI-TOF) $m / z:[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{FN}_{4} \mathrm{O}_{6}, 383.1337$, found 383.1343 .

## Linear tetrapeptide (6):

Compound $4(2 \mathrm{~g}, 5.55 \mathrm{mmol})$ and 5 ( 5.55 mmol ) was coupled using above general procedure to get tetrapeptide ( $R_{f}=0.4$, EtOAc:Hexane (4:6) as white solid, $3.2 \mathrm{~g}, 83.5 \%$ yield, $\mathrm{Mp}=77-79{ }^{\circ} \mathrm{C},[\alpha]_{\mathrm{D}}{ }^{25}=-34.83(c=0.1, \mathrm{MeOH})$, $\mathrm{IR}(\mathrm{KBr}): v_{\max }=3330.1(\mathrm{br}), 3360-$ 2878 (br), $2103.8\left(\mathrm{~N}_{3}\right), 1739.1,1661.9,1000-1111.2$ (strong), $1160-1377 \mathrm{~cm}^{-1}$.
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=7.06$ (dd, $\left.J=8.5 \& 1.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NH}-\mathrm{val}\right), 6.92(\mathrm{dd}, J=8.3 \&$ $3.0 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NH}$-val), 6.39 (t, $J=5.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 5 \mathrm{NH}$ ), 6.03 (d, $J=3.9 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 1 \mathrm{H}), 6.00$ (d, $\left.J=3.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 1 \mathrm{H}^{\prime}\right), 4.85-4.60\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{C} 2 \& \mathrm{C} 4 \mathrm{H} \& \mathrm{C} 4 \mathrm{H}^{\prime}\right), 4.55(\mathrm{dd}, J=8.5 \& 4.6 \mathrm{~Hz}$, $1 \mathrm{H}, \mathrm{Val} \alpha \mathrm{H}$ ), 4.33 (dd, $\left.J=8.3 \& 6.09 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Val} \alpha \mathrm{H}^{\prime}\right), 3.78\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.74-3.66$ (m, $\left.1 \mathrm{H}, \mathrm{C} 5 \mathrm{H} / \mathrm{H}^{\prime}\right), 3.61-3.50\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{C} 5 \mathrm{H} / \mathrm{H}^{\prime}\right), 3.45\left(\mathrm{dd}, J=13.0 \& 4.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 5 \mathrm{H} / \mathrm{H}^{\prime}\right), 2.30-$ $2.20\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{Val} \beta \mathrm{H} / \mathrm{H}^{\prime}\right), 2.14-2.04\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{Val} \beta \mathrm{H} / \mathrm{H}^{\prime}\right), 1.55\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.54\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right)$, $1.33\left(\mathrm{~s}, 6 \mathrm{H}, 2 \times \mathrm{CH}_{3}\right), 0.98\left(\mathrm{~d}, J=6.9,3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.94\left(\mathrm{~d}, J=6.9,6 \mathrm{H}, 2 \times \mathrm{CH}_{3}\right), 0.90(\mathrm{~d}, J=$ $6.8 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ).
${ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=172.1,170.5,164.3(\mathrm{~d}, J=21.8 \mathrm{~Hz}), 163.7(\mathrm{~d}, J=22.0 \mathrm{~Hz})$, 114.0, 113.9, 105.2, 104.9, 98.8 (d, $J=194.4 \mathrm{~Hz}$ ), 99.6 (d, $J=193.7 \mathrm{~Hz}$ ), 84.7 (d, $J=37.5$ $\mathrm{Hz}), 84.5(\mathrm{~d}, J=37.3 \mathrm{~Hz}), 79.8(\mathrm{~d}, J=19.6 \mathrm{~Hz}), 79.3(\mathrm{~d}, J=19.5 \mathrm{~Hz}), 57.9,57.2,52.6,48.4$ (d, $J=8.2 \mathrm{~Hz}$ ), 36.5 (d, $J=8.5 \mathrm{~Hz}$ ), 31.4, 30.8, 26.9 ( s ), 26.6, 26.5, 19.2, 19.0, 17.7, 17.6. HRMS (ESI-TOF) $m / z:[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{29} \mathrm{H}_{44} \mathrm{~F}_{2} \mathrm{~N}_{6} \mathrm{O}_{11}, 713.2928$, found 713.2940.

## Linear hexapeptide (8):

Compound $\mathbf{6}(2 \mathrm{~g}, 2.88 \mathrm{mmol})$ was dissolved in methanol in presence of $10 \% \mathrm{Pd} / \mathrm{C}$ under $\mathrm{H}_{2}$ at balloon pressure to give amine (please see general procedure for reduction of azide to amine) compound ( 1 equiv.) that on coupling with 5 ( 1 equiv.) using above general procedure to get hexapeptide $\mathbf{8}\left(R_{f}=0.6\right.$, EtOAc:Hexane (1:1) as white solid, $2.3 \mathrm{~g}, 78.8 \%$ yield (over 2 step), $\mathrm{Mp}=104-106{ }^{\circ} \mathrm{C},[\alpha]_{\mathrm{D}}{ }^{25}=-8.4(c=0.11, \mathrm{MeOH})$, IR (KBr): $v_{\max }$ $=3343.5,2961-2875,2106.9\left(\mathrm{~N}_{3}\right), 1742.9,1660.5,1000-1146.4$ (strong), $1200-1375 \mathrm{~cm}^{-}$ 1
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=7.10$ (bt, $J=7.3 \mathrm{~Hz}, 2 \mathrm{H}, 2 \times \mathrm{NH} 1,2$-val), 7.00 (dd, $J=8.4$ \& $2.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{NH} 3-\mathrm{val}), 6.74-6.68(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C} 5 \mathrm{NH} 1), 6.67-6.60(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C} 5 \mathrm{NH} 2), 6.05(\mathrm{~d}$, $J=3.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 1 \mathrm{H} 1), 6.02(\mathrm{~d}, J=3.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 1 \mathrm{H} 2), 6.00(\mathrm{~d}, J=3.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C} 1 \mathrm{H} 3), 4.83$ $-4.60(\mathrm{~m}, 6 \mathrm{H}, \mathrm{C} 2-\& \mathrm{C} 4-\mathrm{H}, 1,2,3), 4.53(\mathrm{dd}, J=8.4 \& 4.7 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{Val} \alpha \mathrm{H} 1), 4.37-4.29$ (m, $2 \mathrm{H}, 2 \mathrm{x} \operatorname{Val\alpha H}$ ), $3.80\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.80-3.44\left(\mathrm{~m}, 6 \mathrm{H}, 3 \times \mathrm{C}_{2} \mathrm{CH}_{2}\right), 2.30-2.20(\mathrm{~m}, 1 \mathrm{H}$, $\operatorname{Val} \beta \mathrm{H}), 2.22-2.05(\mathrm{~m}, 2 \mathrm{H}, 2 \mathrm{xVal} \beta \mathrm{H}), 1.55\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.54\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CH}_{3}\right), 1.35(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{CH}_{3}$ ), $1.34\left(\mathrm{~s}, 6 \mathrm{H}, 2 \times \mathrm{CH}_{3}\right), 0.97\left(\mathrm{~d}, J=6.9,3 \mathrm{H}, \mathrm{CH}_{3}\right), 0.93-0.91\left(\mathrm{~m}, 9 \mathrm{H}, 3 \times \mathrm{CH}_{3}\right), 0.88$ (d, $J=6.8 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CH}_{3}$ ).
${ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=172.1,170.8,170.5,164.5(\mathrm{~d}, J=21.9 \mathrm{~Hz}), 164.2(\mathrm{~d}, J=$ $21.9 \mathrm{~Hz}), 163.8(\mathrm{~d}, J=22.0 \mathrm{~Hz}), 114.0,113.9,113.8,105.2,104.9,104.8,100.2(\mathrm{~d}, J=194.8$ $\mathrm{Hz}), 100.1(\mathrm{~d}, J=194.6 \mathrm{~Hz}), 100.0(\mathrm{~d}, J=194.7 \mathrm{~Hz}), 84.7(\mathrm{~d}, J=37.4 \mathrm{~Hz}), 84.5(\mathrm{~d}, J=37.6$ $\mathrm{Hz}), 84.4(\mathrm{~d}, J=37.3 \mathrm{~Hz}), 79.9(\mathrm{~d}, J=19.6 \mathrm{~Hz}), 79.3(\mathrm{~d}, J=19.1 \mathrm{~Hz}), 79.1(\mathrm{~d}, J=17.9 \mathrm{~Hz})$, $58.1,58.0,57.3,52.6,48.4(\mathrm{~d}, J=8.2 \mathrm{~Hz}), 36.8(\mathrm{~d}, J=9.0 \mathrm{~Hz}), 36.7(\mathrm{~d}, J=9.7 \mathrm{~Hz}), 31.2$, 31.0, 30.8, 26.9, 26.8, 26.8, 26.6, 26.5 (s), 19.2, 19.1, 18.9, 17.7, 17.6, 17.5. HRMS (ESITOF) $m / z:[\mathrm{M}+\mathrm{Na}]^{+}$calcd for $\mathrm{C}_{43} \mathrm{H}_{65} \mathrm{~F}_{3} \mathrm{~N}_{8} \mathrm{O}_{16}, 1029.4363$, found 1029.4358.

## Cyclo-[(3S, 4R)- $\gamma-$ FFSAA-(S)-Val-(3S, 4R)- $\gamma-$ FFSAA-(S)-Val] (1):

Compound $\mathbf{6}(1 \mathrm{~g}, 1.44 \mathrm{mmol})$ was converted to compound $\mathbf{1}$ by using general procedure for macrocyclization. Compound $1\left(R_{f}=0.5\right.$, EtOAc:Hexane (6:4) as white solid, $0.55 \mathrm{~g}, 60 \%$ yield (over 2 step), $\mathrm{Mp}=224-226^{\circ} \mathrm{C}$, IR (KBr): $v_{\max }=3420.0$ (br), 3382.6 (br), 3274.6, 1664.7, 1579.5, 1376.6-1221, 1164.3 - 979.7(strong).
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, 9.48 \mathrm{mM}$ ): $\delta=7.13$ (dd, $J=8.5 \& 2.9 \mathrm{~Hz}, 2 \mathrm{H}, 2 \mathrm{x} \mathrm{NH}$-val), $6.23(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 2 \mathrm{H}, 2 \times \mathrm{C} 5 \mathrm{NH}), 6.00(\mathrm{~d}, J=3.9 \mathrm{~Hz}, 2 \mathrm{H}, 2 \times \mathrm{C} 1 \mathrm{H}), 4.87(\mathrm{ddd}, J=25.7$, $11.4 \& 4.0 \mathrm{~Hz}, 2 \mathrm{H}, 2 \times \mathrm{C} 4 \mathrm{H}$ ), $4.63(\mathrm{dd}, J=14.5 \& 3.9 \mathrm{~Hz}, 2 \mathrm{H}, 2 \times \mathrm{C} 2 \mathrm{H}), 4.26-4.14(\mathrm{~m}, 4 \mathrm{H}$, $2 \times$ Val $\alpha \mathrm{H} \& 2 \mathrm{x} \mathrm{C}_{1}$ ), $3.20\left(\mathrm{bd}, J=13.3 \mathrm{~Hz}, 2 \mathrm{H}, 2 \times \mathrm{C} 5 \mathrm{H}_{2}\right.$ ), $2.05-1.90(\mathrm{~m}, 2 \mathrm{H}, 2 \mathrm{x}$ $\operatorname{Val} \beta \mathrm{H}), 1.52\left(\mathrm{~s}, 6 \mathrm{H}, 2 \times \mathrm{CH}_{3}\right), 1.31\left(\mathrm{~s}, 6 \mathrm{H}, 2 \times \mathrm{CH}_{3}\right), 0.92\left(\mathrm{~d}, J=7.0 \mathrm{~Hz}, 6 \mathrm{H}, 2 \times \mathrm{CH}_{3} \mathrm{Val}\right)$, 0.90 (d, $\left.J=6.9 \mathrm{~Hz}, 6 \mathrm{H}, 2 \times \mathrm{CH}_{3} \mathrm{Val}\right)$.
${ }^{13} \mathrm{C}$ NMR ( $125 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=169.7$, $164.1(\mathrm{~d}, J=21.4 \mathrm{~Hz}$ ), 113.5, 104.9, 99.4 (d, $J=$ $200 \mathrm{~Hz}), 85.3(\mathrm{~d}, J=37.9 \mathrm{~Hz}), 78.0(\mathrm{~d}, J=21.3 \mathrm{~Hz}), 57.1,35.5(\mathrm{~d}, J=8.0 \mathrm{~Hz}), 32.9,26.8$, 26.7, 18.4, 18.3. HRMS (ESI-TOF) $m / z:[\mathrm{M}+\mathrm{H}]^{+}$calcd for $\mathrm{C}_{28} \mathrm{H}_{43} \mathrm{~F}_{2} \mathrm{~N}_{4} \mathrm{O}_{10}, 633.2942$, found, 633.2948.

## Cyclo-[(3S, 4R)- $\gamma-$ FFSAA-(S)-Val-(3S, 4R)- $\gamma-$ FFSAA-(S)-Val-(3S, 4R)- $\gamma-$ FFSAA-(S)-Val]

 (2):Compound $\mathbf{8}(1 \mathrm{~g}, 0.99 \mathrm{mmol})$ was converted to compound $\mathbf{2}$ by using general procedure for macrocyclization. Compound 2 ( $R_{f}=0.6$, EtOAc:Hexane (8:2) as white solid, $0.5 \mathrm{~g}, 53 \%$ yield (over 2 step), $\mathrm{Mp}=214-216^{\circ} \mathrm{C}$, IR (KBr): $v_{\max }=3309.3$ (br), 1658.7, 1377.4, 1219.2, 1162 - 1031.6 (strong)
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}, 3 \mathrm{mM}$ ): $\delta=7.03$ (dd, $\left.J=8.6 \& 2.2 \mathrm{~Hz}, 3 \mathrm{H}, 3 \times \mathrm{NH}-\mathrm{val}\right), 6.72$ (dd, $J=6.6 \& 4.3 \mathrm{~Hz}, 3 \mathrm{H}, 3 \times \mathrm{C} N \mathrm{NH}$ ), $6.00(\mathrm{~d}, J=3.8 \mathrm{~Hz}, 3 \mathrm{H}, 3 \times \mathrm{C} 1 \mathrm{H}), 4.69(\mathrm{dd}, J=13.8$ \& $3.9 \mathrm{~Hz}, 3 \mathrm{H}, 3 \times \mathrm{C} 2 \mathrm{H}$ ), 4.60 (ddd, $J=25.9,7.5 \& 5.4 \mathrm{~Hz}, 3 \mathrm{H}, 3 \times \mathrm{C} 4 \mathrm{H}$ ), 4.47 (dd, $J=8.6$ \& $4.8 \mathrm{~Hz}, 3 \mathrm{H}, 3 \mathrm{x}$ ValaH), $3.98-3.89\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{C}_{1} \mathrm{H}_{1}\right.$ ), 3.53 (ddd, $J=13.8,7.6 \& 4.2 \mathrm{~Hz}, 3 \mathrm{H}, 3$ x $\mathrm{C}_{2} \mathrm{H}_{2}$ ), $2.30-2.21(\mathrm{~m}, 3 \mathrm{H}, 3 \times \mathrm{Val} \beta \mathrm{H}), 1.58\left(\mathrm{~s}, 9 \mathrm{H}, 3 \times \mathrm{CH}_{3}\right.$, merged with $\mathrm{H}_{2} \mathrm{O}$ ), $1.36(\mathrm{~s}$, $9 \mathrm{H}, 3 \times \mathrm{CH}_{3}$ ), $0.94\left(\mathrm{~d}, J=6.8 \mathrm{~Hz}, 9 \mathrm{H}, 3 \times \mathrm{CH}_{3}\right), 0.88\left(\mathrm{~d}, J=6.9 \mathrm{~Hz}, 9 \mathrm{H}, 3 \times \mathrm{CH}_{3}\right)$.

Figure S16: ${ }^{1} \mathrm{H}$ NMR spectra of fluorinated $\alpha, \gamma$-cyclic hexapeptide $\mathbf{2}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S17: ${ }^{13} \mathrm{C}$ NMR spectra of fluorinated $\alpha, \gamma$-cyclic hexapeptide $\mathbf{2}$ on 125 MHz in $\mathrm{CDCl}_{3}$.

## 7. 2D NMR Spectra:

Figure S18: ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectra of fluorinated $\alpha, \gamma$-cyclic tetrapeptide $\mathbf{1}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S19: HMBC NMR spectra of fluorinated $\alpha, \gamma$-cyclic tetrapeptide $\mathbf{1}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S20: HSQC NMR spectra of fluorinated $\alpha, \gamma$-cyclic tetrapeptide $\mathbf{1}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S21: ${ }^{1} \mathrm{H}-{ }^{-15} \mathrm{~N}$ HMBC and HSQC NMR spectra of fluorinated $\alpha, \gamma$-cyclic tetrapeptide $\mathbf{1}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S22: ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ NOESY NMR spectra of fluorinated $\alpha, \gamma$-cyclic tetrapeptide $\mathbf{1}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S23: ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectra of fluorinated $\alpha, \gamma$-cyclic hexapeptide $\mathbf{2}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S24: HSQC NMR spectra of fluorinated $\alpha, \gamma$-cyclic hexapeptide $\mathbf{2}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S25: HMBC spectra of fluorinated $\alpha, \gamma$-cyclic hexapeptide $\mathbf{2}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S26: ${ }^{1} \mathrm{H}-{ }^{15} \mathrm{~N}$ HSQC and HMBC NMR spectra of fluorinated $\alpha, \gamma$-cyclic hexapeptide $\mathbf{2}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

Figure S27: ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ NOESY NMR spectra of fluorinated $\alpha, \gamma$-cyclic hexapeptide $\mathbf{2}$ on 500 MHz in $\mathrm{CDCl}_{3}$.

## 8. Schematic NOESY representation:

A)

c)

D)

Figure S28: Characteristic NOEs representation of FCTP 1: observed strong NOEs due to the possible intra-molecular interactions (shown in blue arrow) in monomeric structure (A and B) and weak NOEs between trans proton due to the possible inter-molecular interaction (shown in red arrow) in self-assembled $\beta$-sheet structure ( C and D ).
A)

D)

Figure S29: Characteristic NOEs representation of FCHP 2: observed strong NOEs due to the possible intra-molecular interaction (shown in blue arrow) in monomeric structure (A and B) and weak NOEs between trans proton due to the possible inter-molecular interaction (shown in red arrow) in self-assembled $\beta$-sheet structure ( C and D ).

## 9. HOESY NMRspectra:

Figure S30: ${ }^{1} \mathrm{H}-{ }^{19} \mathrm{~F}$ HOESY NMR spectra in $\mathrm{CDCl}_{3}(500 \mathrm{MHz})$ of fluorinated $\alpha, \gamma$-cyclic tetrapeptide 1.

Figure S31: ${ }^{1} \mathrm{H}-{ }^{19} \mathrm{~F}$ HOESY NMR spectra in $\mathrm{CDCl}_{3}(500 \mathrm{MHz})$ of fluorinated $\alpha, \gamma$-cyclic hexapeptide 2.

## 10. Aggregation studies of 1 and 2 using concentration dependent NMR:

Figure S32: Selected region of ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of $\mathbf{1}$ in $\mathrm{CDCl}_{3}(500 \mathrm{MHz}$, probe temperature $=298 \mathrm{~K}$ ) showed down field shift with increase in concentration (1-60 mM) for amide protons that supports the involvement of molecular aggregations in $\beta$-sheet structure.

Figure S33: Selected region of ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra of $\mathbf{2}$ in $\mathrm{CDCl}_{3}(500 \mathrm{MHz}$, probe temperature $=298 \mathrm{~K})$ showed down field shift with increase in concentration ( $1-60 \mathrm{mM}$ ) for amide protons, which supports the involvement of molecular aggregations in $\beta$-sheet structure.

## 11. Aggregation studies of 1 and 2 by using ESI-MS:

Figure S34: ESI-MS spectra of FCTP 1 indicated self-aggregated mass peaks due to monomer, dimer and trimer formation as shown in full spectrum and its expanded region.

Figure S35: ESI-MS spectra of FCHP 2 indicated self-aggregated mass peaks due to monomer, dimer and trimer formation as shown in full spectrum and its expanded region.

## 12. CD spectroscopy:

Figure S36: Temperature dependent CD spectra of FCTP 1 and in MeOH at $500 \mu \mathrm{M}$ concentration over the range of $20-70^{\circ} \mathrm{C}$.

## 13. Restrained Molecular Dynamics Calculations and Molecular Modeling:

The molecular dynamic studies were carried out on MacroModel with OPLS force field, version 10.3 program from Schrodinger software, using the NOESY restraints. For cyclic peptide $\mathbf{1}$ and $\mathbf{2}$ molecular dynamics calculation was carried out at 300 K in $\mathrm{CDCl}_{3}$ (dielectric constant $=4.7$ ) solvent. Duplicates were detected and eliminated using root-meansquared difference (RMSD) of the torsion angles. These Structures displayed low RMSD values ( $\mathrm{RMSD}<0.3 \AA$ ) on superimposition. Distance constraints used in MD calculations as well as molecular modeling for fluorinated cyclic tetrapeptide (FCTP) $\mathbf{1}$ and fluorinated cyclic hexapeptide (FCHP) $\mathbf{2}$ derived from NOESY experiment are given in Table S2 and S3, respectively.
The tetrameric self-assembly model of CPs 1 and 2 was constructed from the initially obtained monomeric structures from NMR-MD studies. These model assembly structures were prior optimized by molecular mechanics force field method (MMFF) and finely
subjected to semi-empirical PM6 method that resulted tubular self-assembly formation(Figure S37c-f). The self-assembled pores of $\mathbf{1}$ and $\mathbf{2}$ is roughly oval and triangular in shape, respectively, with internal van der Waals diameter of $5.7 \AA$ between the Val- $\alpha$ carbon for $\mathbf{1}$ and $9.7 \AA$ between the Val $\alpha$-carbon sugar C4 carbon for 2. All the calculations were performed by using Spartan'14 software. ${ }^{[2 S]}$

Table S2: Distance constraints used in MD calculations for FCTP $\mathbf{1}$ derived from NOESY experiment.

Figure S37: Superimposed energy minimized NMR-MD structures of FCTP 1 and FCHP 2 (a and b) and schematic side ( c and d ) and top (e and f) views of self-assembled tubular structures obtained by molecular modeling using PM6 method (colours codes for $(\mathrm{a}-\mathrm{b})$ : Carbon $=$ black, oxygen $=$ red, nitrogen $=$ blue, hydrogen $=$ sky blue, fluorine $=$ faint yellow; for $(c-f)$ Carbon $=$ green, oxygen $=$ red, nitrogen $=$ blue, , fluorine $=$ pink. Hydrogen atoms are omitted for sake of clarity.

## 14. X-ray Crystallography (CCDC 1573315):

X-ray intensity data measurements of compound $\alpha, \gamma$-cyclic tetrapeptide (FCTP) $\mathbf{1}$ was carried out on a Bruker D8 VENTURE Kappa Duo PHOTON II CPAD diffractometer equipped with Incoatech multilayer mirrors optics. ${ }^{[3 S]}$ The intensity measurements were carried out with Cu micro-focus sealed tube diffraction source $\left(\mathrm{CuK}_{\alpha}=1.54178 \AA\right.$ ) at 100(2) K temperature. The X-ray generator was operated at 50 kV and 1.1 mA . A preliminary set of cell constants and an orientation matrix were calculated from three sets of 40 frames. Data were collected with $\varphi$ and $\omega$ shutter less scan width of $0.5^{\circ}$ at different settings of $\omega, \varphi$ and $2 \theta$ with a frame time of 60 secs keeping the sample-to-detector distance fixed at 5.00 cm . The X-ray data collection was monitored by APEX3 program (Bruker, 2016). ${ }^{1}$ All the data were corrected for Lorentzian, polarization and absorption effects using SAINT and SADABS programs (Bruker, 2016). ShelX-97 was used for structure solution and full matrix least-squares refinement on $F^{2} .{ }^{2}$ All the hydrogen atoms were placed in a geomerically idalized positions and constrained to ride on its parent atoms. An ORTEP III $^{3}$ view of compound was drawn with $30 \%$ probability displacement ellipsoids and H atoms are shown as small spheres of arbitrary radii.

Crystal data of $\alpha, \gamma$-cyclic tetrapeptide (FCTP) 1 (CCDC 1573315): $\mathrm{C}_{28} \mathrm{H}_{42} \mathrm{~F}_{2} \mathrm{~N}_{4} \mathrm{O}_{10}$, $2.5\left(\mathrm{H}_{2} \mathrm{O}\right), \mathrm{M}=672.65$, colorless needle, $0.0 .44 \times 0.32 \times 0.19 \mathrm{~mm}^{3}$, monoclinic, chiral space group $P 2_{1}, a=14.578(2) \AA, b=13.1698(17) \AA, c=19.698(3) \AA, \beta=106.053(7)^{\circ}, V=$ 3634.4(8) $\AA^{3}, \mathrm{Z}=4, T=100(2) \mathrm{K}, 2 \theta_{\max }=135^{\circ}, D_{\text {calc }}\left(\mathrm{g} \mathrm{cm}^{-3}\right)=1.229, F(000)=1424, \mu$ $\left(\mathrm{mm}^{-1}\right)=0.884,26646$ reflections collected, 11813 unique reflections $\left(R_{\mathrm{int}}=0.1669\right), 7767$ observed $\left(I>2 \sigma(I)\right.$ ) reflections, multi-scan absorption correction, $T_{\min }=0.699, T_{\max }=$ $0.849,956$ refined parameters, number of restraints $=123$, Good of Fit $=S=1.491, R 1=$ $0.1345, w R 2=0.3783$ (all data $R=0.1728, w R 2=0.4271$ ), maximum and minimum residual electron densities; $\Delta \rho_{\max }=0.675, \Delta \rho_{\min }=-0.384\left(\mathrm{e}^{-3}\right)$.

## 15. Ion transport experiments:

## A. Ion transporting activity studies across EYPC-LUV $\supset H P T S:$

Buffer and stock solution preparation: HEPES buffer was prepared by dissolving solid HEPES ( 10 mM ) and $\mathrm{NaCl}(100 \mathrm{mM})$ in Milli-Q water, followed by adjustment of $\mathrm{pH}(\mathrm{pH}=$ 7.0) by addition of 0.5 M NaOH solution. Stock solutions of all cyclic peptide (CP) derivatives were prepared in HPLC grade DMSO.

Preparation of EYPC-LUVs $\supset \mathbf{H P T S}$ : In a clean and dry small round bottom flask, 1 mL of egg yolk phosphatidylcholine (EYPC, $25 \mathrm{mg} / \mathrm{mL}$ in $\mathrm{CHCl}_{3}$ ) was dried by purging nitrogen gas with continuous rotation to form a thin transparent film of EYPC. The transparent film was kept in high vacuum for 8 h to remove all trace of $\mathrm{CHCl}_{3}$ at room temperature. The
resulting film was hydrated with 1 mL buffer ( 1 mM HPTS, 10 mM HEPES, 100 mM NaCl , $\mathrm{pH}=7.0$ ) for 1 h with $4-5$ times occasional vortexing and subjected to freeze-thaw cycle ( $\geq$ 12 times). Extrusions were done 19 times (must be an odd number) by a Mini-extruder, equipped with a polycarbonate membrane of pore size 100 nm (or 200 nm ), obtained from Avanti Polar Lipids. Extravesicular dyes were removed by gel filtration (using Sephadex G50) with buffer ( 10 mM HEPES, $100 \mathrm{mM} \mathrm{NaCl}, \mathrm{pH}=7.0$ ) and diluted to 6 mL to get EYPCLUVs $\neg$ HPTS: ~ 5.0 mM EYPC; inside: 1 mM HPTS, 10 mM HEPES, $100 \mathrm{mM} \mathrm{NaCl}, \mathrm{pH}=$ 7.0 , outside: 10 mM HEPES, $100 \mathrm{mM} \mathrm{NaCl}, \mathrm{pH}=7.0 .^{[4 \mathrm{~S}]}$

Ion transport activity: In a clean and dry fluorescence cuvette, $1975 \mu \mathrm{~L}$ of HEPES buffer ( 10 mM HEPES, $100 \mathrm{mM} \mathrm{NaCl}, \mathrm{pH}=7.0$ ) was added followed by addition of $25 \mu \mathrm{~L}$ of EYPC-LUVs $\supset H P T S$. The cuvette was placed in the fluorescence instrument with slow stirring condition by a magnetic stirrer equipped in the instrument (at $t=0 \mathrm{~s}$ ). The time course of HPTS fluorescence emission intensity, $F_{\mathrm{t}}$ was observed at $\lambda_{\mathrm{em}}=510 \mathrm{~nm}$ ( $\lambda_{\mathrm{ex}}=450 \mathrm{~nm}$ ). 20 $\mu \mathrm{L}$ of 0.5 M NaOH was added to the cuvette at $t=25 \mathrm{~s}$ to create the pH gradient of $\sim 0.8$ between the extra and intra vesicular system. CP derivatives of different concentrations were added at $t=100 \mathrm{~s}$, and finally $25 \mu \mathrm{~L}$ of $10 \%$ Triton $\mathrm{X}-100$ was added at $t=300 \mathrm{~s}$ to lyse vesicles resulting destruction of the pH gradient (Figure S39).

A

Figure S39: Representations of fluorescence based ion transport activity assay using EYPCLUVs $\supset$ HPTS (A), and illustration of ion transport kinetics showing normalization window (B).

For data analysis and comparison, time (X-axis) was normalized between the point of transporter addition (i.e. $t=100 \mathrm{~s}$ was normalized to $t=0 \mathrm{~s}$ ) and end point of experiment (i.e. $t=350 \mathrm{~s}$ was normalized to $t=250 \mathrm{~s}$ ).

Fluorescence intensities $\left(F_{\mathrm{t}}\right)$ were normalized to fractional emission intensity $I_{\mathrm{F}}$ using Equation S1:

$$
I_{\mathrm{F}}=\left[\left(F_{\mathrm{t}}-F_{0}\right) /\left(F_{\infty}-F_{0}\right)\right] \times 100
$$

where, $F_{0}=$ Fluorescence intensity just before the channel forming molecule addition (at 0 s ). $F_{\infty}=$ Fluorescence intensity at saturation after complete leakage (at 320 s). $F_{\mathrm{t}}=$ Fluorescence intensity at time $t$.

The concentration profile data were analyzed by Hill equation (Equation S2) to get the Effective concentration $\left(E C_{50}\right)$ :

$$
Y=Y_{\infty}+\left(Y_{0}-Y_{\infty}\right) /\left[1+\left(c / E C_{50}\right)^{n}\right]
$$

## Equation S2

where, $Y_{0}=$ Fluorescence intensity just before the CP derivative addition (at $t=0 \mathrm{~s}$ ), $Y_{\infty}=$ Fluorescence intensity with excess compound concentration, $c=$ Concentration of channel forming compound.

Figure S40: Concentration dependent ion transport activity of $1(0-20 \mu \mathrm{M})$ across EYPCLUVs $\supset H P T S(A)$. Dose response plot of $\mathbf{1}$ and Hill analysis under the identical condition. The normalized fluorescence intensities at 100 s were used to generate the dose response plot (B).

Figure S41: Dose response plot of 2 and Hill analysis in the identical condition. The normalized fluorescence intensities at 100 s were used to generate the dose response plot (B).

## B. Ion selectivity studies across EYPC-LUVs $\supset$ HPTS:

Buffer and stock solution preparation: HEPES buffer was prepared by dissolving appropriate amount of solid HEPES and a salt (either of $\mathrm{NaCl}, \mathrm{NaF}, \mathrm{NaBr}, \mathrm{NaI}, \mathrm{NaNO}_{3}$, $\mathrm{NaClO}_{4}, \mathrm{LiCl}, \mathrm{KCl}, \mathrm{RbCl}$, and CsCl$)$ in autoclaved milli-Qwater to get 10 mM HEPES and 100 mM salt, respectively. Subsequently, the pH was adjusted to 7.0 by addition of NaOH solution.

Preparation of EYPC-LUVs $\supset$ HPTS: Vesicles were prepared in the same way as stated above.

Anion selectivity assay: In a clean and dry fluorescence cuvette, $1975 \mu \mathrm{~L}$ of HEPES buffer ( 10 mM HEPES, $100 \mathrm{mM} \mathrm{NaA}, \mathrm{pH}=7.0$; where, $\mathrm{A}^{-}=\mathrm{F}^{-}, \mathrm{Cl}^{-} \mathrm{Br}^{-}, \mathrm{I}^{-}, \mathrm{NO}_{3}^{-}$, and $\mathrm{ClO}_{4}^{-}$) was added followed by addition of $25 \mu \mathrm{~L}$ of EYPC-LUVs $\supset$ HPTS in slowly stirring condition by a magnetic stirrer equipped with the fluorescence instrument (at $t=0 \mathrm{~s}$ ). The HPTS fluorescence emission intensity, $F_{\mathrm{t}}$ was observed at $\lambda_{\mathrm{em}}=510 \mathrm{~nm}\left(\lambda_{\mathrm{ex}}=450 \mathrm{~nm}\right)$ with time. $20 \mu \mathrm{~L}$ of 0.5 M NaOH was added to the cuvette at $t=25 \mathrm{~s}$ to create the pH gradient $(\Delta \mathrm{pH} \sim$ 0.8 ) between the intra and extra vesicular system. CP derivatives were added at $t=100 \mathrm{~s}$ and of $10 \%$ Triton X-100 ( $25 \mu \mathrm{~L}$ ) was added at $t=300 \mathrm{~s}$ to lyze vesicles for complete destruction of pH gradient (Figure S 42 A ).

Cation selectivity assay: In a clean and dry fluorescence cuvette, $1975 \mu \mathrm{~L}$ of HEPES buffer ( 10 mM HEPES, $100 \mathrm{mM} \mathrm{MCl}, \mathrm{pH}=7.0$; where, $\mathrm{M}^{+}=\mathrm{Li}^{+}, \mathrm{Na}^{+}, \mathrm{K}^{+}, \mathrm{Rb}^{+}$and $\mathrm{Cs}^{+}$) was added
followed by addition of $25 \mu \mathrm{~L}$ of EYPC-LUVs $\supset$ HPTS in slowly stirring condition by a magnetic stirrer equipped with the fluorescence instrument (at $t=0 \mathrm{~s}$ ). The HPTS fluorescence emission intensity, $F_{\mathrm{t}}$ was observed at $\lambda_{\mathrm{em}}=510 \mathrm{~nm}\left(\lambda_{\mathrm{ex}}=450 \mathrm{~nm}\right)$ with time. $20 \mu \mathrm{~L}$ of 0.5 M NaOH was added to the cuvette at $t=25 \mathrm{~s}$ to create the pH gradient $(\Delta \mathrm{pH}=$ 0.8 ) between the intra and extra vesicular system. CP derivatives were added at $t=100 \mathrm{~s}$ and $10 \%$ Triton X-100 ( $25 \mu \mathrm{~L}$ ) was added at $t=300 \mathrm{~s}$ to lyze vesicles for complete destruction of the pH gradient (Figure S42B).

Figure S42: Schematic representations of the fluorescence based anion (A) and cation (B) selectivity assays.

For data analysis and comparison, time (X-axis) was normalized between the point of compound addition (i.e. $t=100 \mathrm{~s}$ was normalized to $t=0 \mathrm{~s}$ ) and end point of experiment (i.e. $t=350 \mathrm{~s}$ was normalized to $t=250 \mathrm{~s}$ ).

Fluorescence intensities $\left(F_{\mathrm{t}}\right)$ were normalized to fractional emission intensity $I_{\mathrm{F}}$ using Equation S1.

## 16. Anion recognition by ${ }^{1} \mathrm{H}$ NMR titration:

${ }^{1} \mathrm{H}$ NMR titrations were carried out in Bruker 500 MHz spectrometer at room temperature and calibrated to the residual solvent peak in $\mathrm{CDCl} 3(\delta=7.26 \mathrm{ppm})$. Titrations were performed by the addition of aliquots of tetrabutylammonium nitrate $\left(\mathrm{TBANO}_{3}\right)(30 \mathrm{mM}$ $\mathrm{CDCl}_{3}$ ) to the solution of receptor ( $\sim 3 \mathrm{mM}$ ) $\mathrm{CDCl}_{3}$. Both TBA-salt and receptor were dried under high vacuum prior to use. All NMR data were processed in MestReNova 6 software and the change in chemical shift were plotted and that indicated no significant change in amide NHs or proton chemical shift (Figure S43).

Figure S43: ${ }^{1} \mathrm{H}$ NMR titration spectra for $\mathbf{2}$ with stepwise addition of $\mathrm{TBANO}_{3}$ in $\mathrm{CDCl}_{3}$ solution on 500 MHz .

## 17. Anion recognition by ESI-MS spectroscopy:

Stock solutions of 2 and $\mathrm{TBANO}_{3}$ ( 5 mM each) were prepared in spectroscopy grade $\mathrm{CH}_{3} \mathrm{CN}$. Solutions were mixed in equal proportion and diluted to get $5 \mu \mathrm{M}$ concentrations of each species in $\mathrm{CH}_{3} \mathrm{CN}$ and injected and spectra were recorded up to the range of 3500 Da . The ESI-MS data recorded from $\mathrm{CH}_{3} \mathrm{CN}$ solution of $\mathbf{2}$ with $\mathrm{TBANO}_{3}$ prepared in 1:1 molar ratio.

Figure S44: Expanded region of the ESI-MS spectrum that confirms the anion recognition by the supramolecular self-assembly of $\mathbf{2}$.

## 18. Computational Methodology:

## Optimization of $\left[2+\mathrm{NO}_{3}{ }^{-}\right]$complex:

The quantum chemical semi-empirical (PM6) and DFT calculations have been performed to obtain the complex of cyclic hexa-peptide 2 with Nitrate ion [2 $+\mathrm{NO}_{3}{ }^{-}$]. Initially nine different conformational geometries were generated randomly by placing $\mathrm{NO}_{3}{ }^{-}$ionon top or bottom to the cavity of the initially optimized structure of $\mathbf{2}$ from NMR and MD studies. The conformational geometries of $\left[\mathbf{2}+\mathrm{NO}_{3}{ }^{-}\right]$complexes were initially optimized by semiempirical PM6 method. The lowest energy conformation (obtained from PM6 modeling) of $\left[2+\mathrm{NO}_{3}{ }^{-}\right]$was subjected for automated full geometry optimization calculations by ab-initio Density Functional Theory (DFT) method by employing B3LYP/6-31G** basis set function. All calculations were performed by using Spartan'14 (Wavefunction, inc.) molecular
modeling software. Therefore, the most stable conformation was considered as the final optimized structure of the $\left[\mathbf{2}+\mathrm{NO}_{3}{ }^{-}\right]$complex in the gas phase (Figure S45).

Figure S45: Geometry optimized structure of $\left[\mathbf{2}+\mathrm{NO}_{3}{ }^{-}\right]$complex by DFT calculation.
Table S5: Atomic co-ordinates of the optimized structure of lowest energy conformation (Figure S 45 ) obtained for $\left[2+\mathrm{NO}_{3}{ }^{-}\right]$from DFT B3LYP/6-311G** geometry optimization.
